Gli scambiatori della serie **BP** sono la soluzione più economica ed affidabile per chi debba condizionare fluidi ad alta temperatura.

La configurazione a TESTA FLOTTANTE permette di sopportare forti shock termici poiché il fascio è libero di dilatare indipendentemente dal corpo.

Data la particolare applicazione è stata scelta una costruzione con tubi DIRITTI, facilmente pulibili, in quanto i tradizionali fasci ad "U" risultano rapidamente inutilizzabili per i depositi di calcare. Sono realizzate differenti configurazioni per materiali e tipi di tubi impiegati; due sono le classi per temperatura: tipo O e tipo H.

Per la definizione delle varianti vedi foglio CODICE PRODOTTO.

NOTA - Lo scambiatore viene fornito privo di coibentazione. Provvedere all'atto della installazione ad adeguata protezione.

The **BP** type coolers are the cheapest solution to handle fluids with high operating temperatures, without hazard of thermal shock.

Designed with a FLOATING HEAD and straight tubes it will solve not only the problem of thermal shock, but also the lack that is the tubeside is easily cleaned from calcium deposits even without draining the shellside fluid.

Having no hairpin-like bend tubes, as the traditional "U" bundle, if necessary it can be inspected inside tubes for perfect mechanical cleaning.

BP coolers are made with different types of tubes; as size and materials; two types for temperature: design tipe O and type H. For orders please see detailed sheet PRODUCT CODE.

NOTE - The cooler is delivered without thermal insulation, for safety reasons it must be provided with protection on site!

★ L'alternativa realizzata con tubi in rame alettato necessita modifiche alle dimensioni: le misure "A" e "B" del catalogo vanno ridotte di 25 mm.

★ Alternative of finned copper tubes need different dimension: the measures "A" and "B" of the catalogue will get also reduced by 25 millimeters.

Dimensioni e caratteristiche non impegnative. Tolleranze secondo norme. - Dimensions and characteristics of the catalogue are subject to change without notice. Clearances according to international standards.

Scambiatori in esecuzione a fascio tubiero fisso. Particolarmente adatti per condensare e raffreddare fluidi e GAS in controcorrente perfetto. Facile installazione direttamente in linea sulle tubazioni con flange UNI - PN 10. Esecuzione base tipo **OL 9** con corpo in acciaio al carbonio e fascio con tubi 3/8" inox (Ø 9.5 mm).

A richiesta differenti opzioni di flange (ANSI - DIN) e di materiali corpo e fascio. Per la definizione delle varianti vedi foglio CODICE PRODOTTO.

Special fixed bundle "ON-LINE" coolers to cool air or other gases inside the tubes, with water on shellside, in what we can call: a "perfect counterflow". Easy connection with UNI PN 10 flanges.

Standard design with carbon steel shell, with stainless bare tubes of 3/8" (equivalent to 9,5 mm) = type **OL 9**.

Options: connections according to ANSI or DIN; different materials available for shell, tubesheets and inertubes.

For orders please see sheet PRODUCT CODE.

Dimensioni e caratteristiche non impegnative. Tolleranze secondo norme. - Dimensions and characteristics of the catalogue are subject to change without notice. Clearances according to international standards.

FASCIO A SPIRALE ALETTATA INSTALLAZIONE INTERNA OD ESTERNA

Finned coil tubebundle
Inside or outside installation

SCAMBIATORI
HEAT EXCHANGERS

Negli scambiatori della serie **FC** il fascio tubiero è costituito da un tubo in rame ad alettatura integrale ad alta efficienza avvolto a spirale.

Questo particolare tipo di costruzione oltre ad avere consumi d'acqua estremamente bassi, consente l'impiego nei casi di forte "stress" termico, avendo il fascio liberamente dilatabile.

FC R e FC W

Spirale alettata con raccordi (FC R) o flangiata (FC W) da inserire direttamente nel serbatoio

Nota: i rendimenti sono legati ai moti turbolenti all'interno del serbatoio.

FC X

Spirale alettata completa di corpo per montaggio esterno in esecuzione a fascio estraibile.

FC T

Spirale alettata completa di corpo per montaggio in serbatoio.

In the series of exchangers type **FC** the tube bundle is made of an integral highfined single coppertube made up in a coil.

This particular construction has extremely low water-consumption and having the possibility of a free expansion this will allowe good resistance to thermal stress.

FC R and FC W

Finned coil with threaded connections (FC R) or flange support (FC W) to fix directly into the tank.

Note: the efficiency is strictly connected with inside tank oil turbulence.

FC X

Finned coil with shell, for forced circulation, pull out bundle, and service outside tank.

FC T

Finned coil with shell, for forced circulation to be fixed into the tank.

SCAMBIATORI DI CALORE SERIE KE (tipo BEU)

Gli scambiatori di calore serie **KE** sono forniti di fascio tubiero ad "U" che può dilatarsi liberamente. Sono quindi particolarmente indicati per il condizionamento di fluidi ad elevata temperatura (vapore, olio diatermico, acqua surriscaldata, ecc.). L'accurata progettazione meccanica, la perfetta lavorazione, ed i materiali di prima qualità che vengono impiegati, assicurano una resa termica specifica molto elevata ed un'ottima affidabilità nel tempo.

La serie **KE** è realizzata con componenti standardizzati costruiti in grande serie e sempre disponibili a magazzino; questo permette l'eventuale sostituzione dei pezzi in sede di futuri controlli ed una consegna molto rapida degli apparecchi finiti. Nella serie **KE** il fascio tubiero piegato ad "U" è estraibile. Ciò consente di intervenire con la massima facilità per le periodiche manutenzioni.

HEAT EXCHANGERS KE SERIES (BEU type)

The "U" shaped tube bundle in **KE** series heat exchangers can freely dilate. These exchangers are therefore especially indicated for both heating and cooling of high temperature fluids (steam, diathermic oil, superheated water, etc.). Accurate engineering, perfect workmanship and top quality materials assure a long term reliability and high specific heat capacity.

The **KE** series is completely made of standardized components, always available by our warehouse. This assures an eventual, quick substitution of the components and allows fast efficient, maintenance and delivery time.

Dimensioni e caratteristiche non impegnative. Tolleranze secondo norme. - Dimensions and characteristics of the catalogue are subject to change without notice. Clearances according to international standards.

RISCALDATORI ELETTRICI Electric heaters

HR E

ELEMENTO RISCALDANTE

Resistenza in ferro con corpo in ottone per riscaldare olio con viscosità max ISO VG 68, da inserire direttamente nel serbatoio. Attacco filettato Ø 2" con guarnizione piana. Prevedere l'installazione in una zona di forte turbolenza per aumentare l'efficienza termica. Potenza resa ~ 2,5 watt/cm² a 230 - 400 V; altre tensioni a richiesta. Coperchio di protezione dei collegamenti in gomma con protezione IP 54. Esecuzione stagna antideflagrante a richiesta. Per applicazioni con differenti fluidi contattare nostro ufficio tecnico.

HEATING ELEMENT

Heating element for oil with max viscosity ISO VG 68. Body and thread in yellow brass alloy, resistance of carbon steel U bend shaped to be inserted directly into the tank. Threaded 2" B.S.P. connection to install near the part of the tank with turbulence to raise the thermal efficiency. Thermal rating about 2,5 (watt/cmsq). Standard Voltage 230/400 (other Voltages on request). Protection of cables in rubber cap, protection IP 54. Special executions as "waterproof" and "flameproof" on request. For applications with different fluid please contact our technical office.

RISCALDATORI ELETTRICI IN LINEA

Elemento riscaldante **HR E** inserito in un corpo. Maggiore efficienza termica senza possibilità di surriscaldamento. Ampia gamma di versioni con una o più resistenze smontabili e sostituibili. Robusto corpo in acciaio al carbonio. Potenza resa ~ 2,5 watt/cm² - 230 - 400 V; altre tensioni a richiesta. Coperchio di protezione dei collegamenti in gomma con protezione IP 54. Esecuzione stagna antideflagrante a richiesta.

ELECTRIC HEATERS ON LINE

Heating element **HR E** type fitted into a shell. For oil, gasoil, cherosene, other types, made for high efficiency, heat dynamically in full stream of flow avoiding over heating. Modular construction with one, three or four candles fitted into rugged carbon steel housing. Easy substitution of the heating elements. Thermal rating about 2.5 (watt/cmsq). Standard Voltage 230/400 (other Voltages on request). Protection of cables in rubber cap. Protection IP 54. Special executions as "waterproof" and "flameproof" on request.

HR T

RISCALDATORI ELETTRICI IMMERSI

Elemento riscaldante **HR E** inserito in un corpo. Facile montaggio a flangia con guarnizione piana direttamente al serbatoio. Ampia gamma di versioni con una e più resistenze smontabili e sostituibili. Robusto corpo in acciaio al carbonio. Potenza resa ~ 2,5 watt/cm² a 230 - 400 V; altre tensioni a richiesta. Coperchio di protezione dei collegamenti in gomma con protezione IP 54. Esecuzione stagna antideflagrante a richiesta.

ELECTRIC IMMERSION HEATERS

Heating element **HR E** type fitted into a shell. For oil our types, with flange and plain gasket to be fitted into the tank, but using the dynamic way of heating "one line" pouring the oil tank. Modular construction with one, three or four candles, rugged carbon steel housing with most part hidden in tank will solve many problems of space. Thermal rating about 2,5 (watt/cmsq). Standard Voltage 230/400 (other Voltages on request). Protection of cables in dielectric rubber cap. Protection IP 54. Special executions as "waterproof" and "flameproof" on request.

ATTENZIONE - Per evitare eventuali danni di sovratemperatura prevedere sempre nell'impianto un elemento termostatico di sicurezza per il controllo dei vari tipi di resistenza di riscaldamento.

ATTENTION - To avoid damages as burning or cracking of the fluids due to overheting, the system must be provided with thermostatic control!

Materiale

Massa radiante : Alluminio
Ventola : Alluminio o plastica rinforzata
Convogliatore, griglia di protezione : Acciaio al carbonio

Termostati disponibili (Contatti N.A.)

TA : Protezione IP 54 48°C
TB : Protezione IP 65 48°C
TBR : Protezione IP 65 40°C ÷ 85°C

Gli scambiatori ARIA/OLIO serie **RSA** sono realizzati mediante l'impiego di una robusta massa radiante in alluminio con canali di passaggio muniti di turbolatori per aumentare l'efficienza termica.

Il profilo laterale, senza le connessioni, consente un più facile montaggio e necessita di un minore ingombro frontale.

La rumorosità è contenuta in un valore max di 76 dB(A) / 1m.

I piedi di fissaggio sono smontabili ed orientabili in diverse posizioni con l'interposizione di elementi antivibranti in gomma.

Un'attenta scelta della forma del convogliatore d'aspirazione consente di sfruttare al meglio il flusso d'aria.

Sono previste esecuzioni speciali con motori antideflagranti.

Material

Main cooler Body : Aluminium
Fan : Aluminium or Hard plastic
Fan protection : Carbon steel

Thermostat optional (Contact N. O.)

TA : Protection IP 54 48°C
TB : Protection IP 65 48°C
TBR : Protection IP 65 40°C ÷ 85°C

*Air-oil coolers of **RSA series** are realized by a strong aluminium radiant mass with passing canals equipped with turbulence device in order to increase the thermic efficiency*

The overall side profile allows an easy assemble of the cooler since there isn't the hindrance caused by the connections and consequently it needs a smaller room.

The noise factor is 76 dB(A) at 1 mt maximum.

The support saddles can be desmantled and oriented in different positions. The saddles are equipped with anti-vibrations rubber device.

A correct choice of extractor plenum frame let to exploit completely the air-flow.

Special executions with EEXD motor are available.

Dimensioni e caratteristiche non impegnative. Tolleranze secondo norme. - Dimensions and characteristics of the catalogue are subject to change without notice. Clearances according to international standards.

SCAMBIATORI AD ARIA IN ALLUMINIO

Air coolers aluminium block

SCAMBIATORI
HEAT EXCHANGERS

Diagrammi di rendimento e selezione dello scambiatore ideale

Consentono di selezionare il modello sulla base della potenzialità termica da smaltire, della temperatura di ingresso dell'olio, della temperatura massima dell'aria e della portata dell'olio.

Sull'asse delle ascisse viene indicata la portata dell'olio in litri per minuto, sulle ordinate viene indicato il rendimento η , come rapporto tra la potenzialità termica (espressa in kcal/h) e la differenza tra la temperatura massima di ingresso olio e la temperatura massima dell'aria (entrambe in °C o °K).

Efficiency Diagrams and selection of ideal cooler size

Ideal cooler size selection from the diagram is based on the duty, inlet oil temperature, maximum air temperature, and oil flow.

Oil flow (lt per min) is indicated on X-axis. On Y axis the efficiency, η , is reported as ratio between maximum oil inlet temperature and maximum air temperature (°C or °K).

$$\eta = \text{Rendimento} = \frac{Q, \text{ potenzialità, kcal / h}}{DT_o}$$

$DT_o = \text{Ingresso olio} - T \text{ massima aria } ^\circ\text{C oppure } ^\circ\text{K}$

$$\eta = \text{Efficiency} = \frac{Q, \text{ duty, kcal / h}}{DT_o}$$

$DT_o = \text{Inlet oil} - T \text{ max air } ^\circ\text{C or } ^\circ\text{K}$

Calcolo della potenzialità termica

Nel caso non sia conosciuto il valore della potenzialità termica, questi può essere calcolato con la seguente formula:

$$Q = C_p \times \gamma \times G \times DT$$

dove:

Q = potenzialità termica = kcal / h
Cp = calore specifico = kcal / kg°C
γ = peso specifico = kg / m³
G = portata olio = lt / h
DT = ingresso olio - T uscita olio = °C oppure °K

Calculation of the duty

If the duty is unknown, it can be calculated by the following formula:

$$Q = C_p \times \gamma \times G \times DT$$

where:

Q = duty = kcal / h
Cp = specific heat = kcal / kg°C
γ = specific weight = kg / m³
G = oil flow = lt / h
DT = inlet oil - T outlet oil = °C or °K

Nel caso di un olio minerale di cui non si conoscano calore specifico e/o la densità, si può considerare con buona approssimazione il valore:

$$C_p \times \gamma = 0.4 \quad [\text{kcal / lt } ^\circ\text{C h}]$$

Esempio: T olio ingresso = 70°C, T olio uscita = 63°C,
 Portata = 100 (lt / min) x 60 = 6.000 lt / h
Q = 0.4 x 6.000 x 7 = 16.800 kcal / h

For a mineral oil typical values of specific Heat and specific weight are the following:

$$C_p \times \gamma = 0.4 \quad [\text{kcal / lt } ^\circ\text{C h}]$$

Example: T inlet oil = 70°C, T outlet oil = 63°C,
 Flow = 100 (lt / min) x 60 = 6.000 lt / h
Q = 0.4 x 6.000 x 7 = 16.800 kcal / h

Dimensioni e caratteristiche non impegnative. Tolleranze secondo norme. - Dimensions and characteristics of the catalogue are subject to change without notice. Clearances according to international standards.

SCAMBIATORI AD ARIA

Aircoolers

SCAMBIATORI
HEAT EXCHANGERS

CARATTERISTICHE GENERALI

Gli scambiatori serie **LT**, con raffreddamento forzato ad aria, si pongono quale valida alternativa all'impiego dei tradizionali scambiatori a fascio tubiero, qualora non si disponga di acqua o se ne voglia evitare il consumo.

Particolare cura è stata posta allo studio dei vari componenti per raggiungere elevata efficienza termica e robustezza.

Per una totale affidabilità ogni apparecchio viene collaudato a 30 Bar.

PERDITE DI CARICO

Al fine di ottimizzare i rendimenti con un giusto valore di caduta di pressione, vengono proposte due versioni di apparecchi

- tipo A per portate medio-basse
- tipo B per portate più alte.

Le perdite di carico indicate nei diagrammi di rendimento sono calcolate per olio con viscosità 4°E a 50°C. Con olio più viscoso o con temperature di funzionamento più basse si hanno variazioni sostanziali dei valori. Per evitare danni all'impianto in particolare durante l'avviamento a freddo, si consiglia di escludere lo scambiatore dal circuito mediante l'inserimento di un by-pass tarato alla pressione di 4-5 Bar.

APPLICAZIONI SPECIALI

Gli scambiatori serie **LT** possono essere utilizzati, oltre che per il raffreddamento dell'olio, per i più svariati fluidi e gas in pressione, compatibilmente coi materiali impiegati.

È prevista la realizzazione, su richiesta, di unità speciali, multipli dei modelli base, di cui si mantengono le caratteristiche costruttive, raggiungendo anche potenzialità di scambio molto elevate. Il ns. ufficio tecnico dispone di un collaudato sistema di calcolo computerizzato in grado di simulare le reali condizioni di lavoro per ottimizzare le scelte e ne fornisce una specifica termica completa di tutti i dati di funzionamento.

CARATTERISTICHE COSTRUTTIVE

Per garantire elevate pressioni di esercizio resistenza alle vibrazioni ed elevato scambio termico si utilizza un pacco radiante composto da alette continue di alluminio, fissate ai tubi di rame mediante espansione meccanica.

I collettori sono dimensionati per consentire il passaggio dell'olio alla portata prevista.

Ogni apparecchio è corredato da un termostato a taratura fissa, da collegare al motore, per l'inserimento della ventola alla temperatura di 40-48°C.

Motore elettrico e ventola sono previsti per funzionamento al 100% e con livello di rumorosità particolarmente basso.

GARANZIA

Ogni apparecchio è garantito contro i difetti di fabbricazione o dei materiali per la durata di mesi 12. Nessuna garanzia contro la corrosione, vibrazioni eccessive, colpi di ariete, incrostazioni ed errato montaggio.

GENERAL CHARACTERISTICS

The fan exchangers, cooling with forced airdraft, are an extremely valid alternative to tube & shell exchangers, where no cooling water is available.

Particular care has been taken to select all components able to give good thermal efficiency together with rugged construction. To reach complete affidability all our fancoolers are tested at 30 (Bar).

FLOWRATE & PRESSURE DROP

To optimise efficiency against allowable pressure drop, coolers are of two types: low flowrate = type "A"; high flowrate = type "B".

Pressure drop indicated on the performance curves are intended with oil viscosity of 4°E-50°C. With other oils than the mentioned, proper calculation should be made. Specially with cold start of the machine at low temperatures a by-pass should be used, with pressure setting of 4-5 (Bar).

SPECIAL APPLICATIONS

Fan-type exchangers could also be used for compressed air, other gas, water, depending on fan materials.

The versatility of our design allows us to make multiple of our basic models, two or more standard or special fans & motors, more rows of tubes with tubelength according to proper computerised calculation.

Heat transfer calculation and fancooler size optimization made by simulation of real conditions with our computer, to minimise possible errors, giving specification sheet complete with constructional and heat transfer data available from our technical department for each project.

CONSTRUCTION

Copper inertubes of small diameter expanded to integral aluminium fins, punched with small lips to extend contact surface, and to give protection against vibration.

Inlet/outlet connections in carbon steel pipe sized to take flow at nominal pressure.

Each cooler is supplied with thermostatic contact to insert the fan between 40-48 °C.

Electric motor & fan able to operate 100% of time, with low noise.

WARRANTY

Each exchanger is guaranteed against defect of fabbrication, or of the materials for 12 months.

No guarantee will be hold against corrosion, excessive vibrations, pressure hammering, calcium deposit and uncorrect installation.

Scambiatore ad aria tipo **LTD** con doppio elettroventilatore.

*Double fancooler type **LTD** with two motors ventilators.*

Scambiatore speciale completamente in inox AISI 316 con motore antideflagrante per impianto idraulico in ambiente geotermico altamente corrosivo.

Special cooler completely in stainless steel AISI 316 with flameproof motor for hydraulic equipment working in geothermic highly corrosive site.

Scambiatore ad aria con grande potenzialità termica per impianto chimico.

Aircooler for high dutyrating for chemical plant.

Scambiatori con raffreddamento ad aria per ambienti pericolosi e in applicazioni gravose. Realizzazione secondo norme con tubi alettati in rame, alluminio, inox, titanio, ecc.

Heavy duty aircooled exchangers to suite most codes, flameproof and hazardous applications. Made with bare or finned tubes. Materials as carbon steel, copper alloys, stainless or light alloy to suite most prescriptions.

GENERAL INFORMATION OPERATING AND MAINTENANCE OF HEAT EXCHANGERS

SUCCESSFUL PERFORMANCE of heat transfer equipment, length of service and freedom from operating difficulties are largely dependent upon:

1. Proper thermal design.
2. Proper physical design.
3. Manner of installation, including design of foundation and piping.
4. The method of operation.
5. The thoroughness and frequency of cleaning.
6. The materials, workmanship, and tools used in maintenance and making repairs and replacements.

FAILURE TO PERFORM properly may be due to one or more of the following:

1. Exchanger being dirty.
2. Operating conditions being different than design conditions.
3. Air or gas binding.
4. Incorrect piping connections.
5. Excessive clearance between baffles and shell due to corrosion.
6. Improper application.

INSTALLATION PLANNING

1. On removable bundle heat exchangers provide sufficient clearance at the stationary end to permit the removal of the tube bundle from the shell. On the floating head end, provide space to permit removal of the shell cover and floating head cover.
2. On fixed bundle heat exchanger, provide sufficient clearance at one end to permit removal and replacement of tubes and at the other end sufficient clearance to permit tube rolling.
3. Provide valves and bypasses in the piping system so that both the shell side and tube side may be bypassed to permit isolation of the heat exchanger for inspection, cleaning and repairs.
4. Provide convenient means for frequent cleaning as suggested under maintenance.
5. Provide thermometer wells and pressure gauge Pipe taps in all piping to and from the heat exchanger located as close to the heat exchanger as possible.
6. Provide necessary air vent valves for the heat exchanger so that it can be purged to prevent or relieve vapor or gas binding on either the tube side or shell side.
7. Provide adequate supports for mounting the heat exchanger so that it will not settle and cause piping strains. Foundation bolts should be set accurately. In concrete footings, pipe sleeves at least one pipe size larger than the bolt diameter slipped over the bolt and cast in place are best for this purpose as they allow the bolt centers to be adjusted after the foundation has set.
8. Proper liquid level controls and relief valves and liquid level and temperature alarms, etc., should be installed.
9. Gauge glasses or liquid level alarms should be installed in all vapor or gas spaces to indicate any failure occurring in the condensate drain system and prevent flooding of the heat exchanger.
10. A surge drum should be installed upstream from the heat exchanger to guard against pulsation of fluids caused by pumps, compressors or other equipment.

11. Drain connections should not be piped to a common closed manifold so that it may be determined that the exchanger has been thoroughly drained.

INSTALLATION AT JOBSITE

CAUTION: Dress properly for the job. You may need any number of special items-safety hat, safety shoes, goggles, heavy gloves, ear protective devices, etc., for your own protection. Find out what items are required and wear them.

1. On receipt of the heat exchanger at the jobsite, inspect for shipping damage to all protective covers. If damage is evident, inspect for possible contamination and replace protective covers as required. If damage is extensive, notify the carrier immediately.
2. Store under cover in a heated area, if possible.
3. If the heat exchanger must be stored for a period exceeding 30 days, precautions should be taken to prevent rusting or contamination. Following extended storage, it is suggested that the exchanger be thoroughly inspected prior to installation.
4. When installing, set heat exchanger level and square so that pipe connections can be made without forcing.
5. Before piping up, inspect all openings in the heat exchanger for foreign material. Remove all wooden Plugs, bags of desiccant and shipping covers immediately prior to installing. Do not expose internal passages at the heat exchanger to the atmosphere since moisture or harmful contaminants may enter the unit and cause severe damage to the system due to freezing and/or corrosion.
6. After piping is complete, if support cradles or feet are fixed to the heat exchanger, loosen foundation bolts at one end of the exchanger to allow free movement. Oversize holes in support cradles or feet are provided for this purpose.

7. If heat exchanger shell is equipped with a bellows type expansion joint, remove shipping supports per instructions.

OPERATION

1. Be sure entire system is clean before starting operation to prevent plugging of tubes or shell side passages with refuse. The use of strainers or settling tanks in pipe lines leading to the heat exchanger is recommended.
2. Open vent connections before starting up.

CAUTION: A heat exchanger is a pressure vessel designed for operation at certain specific limits of pressure and temperature. The cooling or process system, which includes the heat exchanger, must be safeguarded with safety valves and controls so that these heat exchanger design conditions are not exceeded. All operating personnel should be made aware of these specific design pressures and temperatures.

3. Start operating gradually. See Table 1 for suggested startup and shutdown procedures for most applications. If in doubt, consult FLOVEX Technical office for specific instructions.
4. After the system is completely filled with the operating fluids and all air has been vented, close all manual vent connections.
5. Bolting on all gasketed or packed joints should be retightened after the heat exchanger has reached operating temperatures to prevent leaks and gasket failures.

CAUTION: Many heat exchanger circulate fluids which are irritating or dangerous to the human system. These fluids could cause problems if bolted or threaded joints are not maintained in a leak-tight condition at operating pressures, temperatures and no-flow, ambient conditions. If fluids are not irritating or dangerous, a leak will at least cause a slippery situation on the floor below. Since one fluid the heat exchanger is at higher temperatures, any leaks might cause burns.

6. Do not operate the heat exchanger under pressure and temperature conditions in excess at those specified on the name plate.
7. To guard against water hammer, condensate should be drained from steam heated exchangers and similar apparatus both when starting up and shutting down.
8. Drain all fluids when shutting down to eliminate possible freezing and corroding.
9. In all installations there should be no pulsation of fluids since this causes vibration and will result in reduced operating life.

MAINTENANCE

CAUTION: Do not remove channel covers, shell covers, floating head covers or bonnets until all pressure in the heat exchanger has been relieved and both shell side and tube side are completely drained.

1. Exchangers subject to fouling (scale, sludge deposits, etc.) should be cleaned periodically depending on specific conditions. A light sludge or scale coating on either side at the tube greatly reduces its effectiveness. A marked increase in pressure drop and/or reduction in performance usually indicates cleaning is necessary. Since the difficulty of cleaning increases rapidly as the scale thickens or deposits increase, the intervals between cleanings should not be excessive.
2. Neglecting to keep tubes clean may result in random tube plugging. Consequent overheating or cooling at the plugged tubes, as compared to surrounding tubes, will cause physical damage and leaking tubes due to differential thermal expansion of the metals.
3. To clean or inspect the inside at the tubes, remove only the necessary tube side channel covers or bonnets depending on type of exchanger construction.

CAUTION: Since many of the removable components of the heat exchanger, particularly in the larger sizes, are too heavy for men to handle, care must be used to take this weight with proper rigging to avoid injury. Wear hard hats and safety shoes as required.

4. If the heat exchanger is equipped with zinc wasting pencils or plates, replace these as required.
5. To clean or inspect the outside of the tubes, it may be necessary to remove the tube bundle. (Fixed tubesheet exchanger bundles are non-removable.)
6. Some suggested methods at cleaning either the shell side or tube side are listed below:
 - ...Circulating hot wash oil or light distillate through tube side or shell side will usually effectively remove sludge or similar soft deposits.
 - ...Soft salt deposits may be washed out by circulating hot fresh water.
 - ...Some commercial cleaning compounds such as "Oakite" or "Dowell" may be effective in removing the more stubborn deposits. Use in accordance with the manufacturer's instructions.

CAUTION: When the heat exchanger is cleaned, it is important that full characteristics of the fouling material and care exercised in handling them according to instructions. Use eye protection to prevent damage to your eyes. Wear a respirator when required.

7. If the heat exchanger has been in service for a considerable length at time without being removed, it may be necessary to use a jack on the floating tubesheet to break the bundle free.

...A good-sized steel bearing plate should be used with a filler board between the tubesheet face and bearing plate to protect the tube ends.

8. Tube bundles may be lifted horizontally by means of a cradle formed by bending a light-gauge plate or plates into a U shape. Attachments are made in the legs at the U for lifting.

9. Bundles should not be dragged since baffles or support plates may become easily bent. Any damage to baffles must be avoided so that the heat exchanger will function properly.

10. Following are safe loads for rods and eyebolts:

RODS			EYEBOLTS	
size tubes	size rods	safe load per rod	size	safe load
5/8"	3/8"	1,000 lbs	3/4"	4,000 lbs
3/4"	1/2"	2,000 lbs	1"	6,000 lbs
1" or larger	5/8"	3,000 lbs	1 1/4"	10,000 lbs
			1 1/2"	15,000 lbs

11. When removing tube bundles from heat exchangers for inspection or cleaning, care should be exercised to see that they are not damaged by improper handling.

...The weight of the tube bundle should not be supported on individual tubes but should be carried by the tubesheets, support or baffle plates or on blocks con-toured to the periphery of the tube bundles.

...Do not handle tube bundles with hooks or other tools which might damage tubes. Tube bundles should be moved about on cradles or skids.

...To withdraw tube bundles, it is recommended that rods be passed through two or more of the tubes and the load taken on the floating tubesheet.

...Rods should be threaded at both ends and provided with nuts and should pass through a steel bearing plate at each end of the bundle.

...A soft wood filler board should be inserted between the bearing plate and tubesheet face to prevent damage to the tube ends.

...Forged steel eyebolts should be screwed into both bearing plates for pulling and lifting.

...As an alternate to the rods, a steel cable can be threaded through one tube and returned through another tube.

...A hardwood spreader block must be inserted between the cable and the floating tubesheet to prevent damage to the tube ends.

12. Do not attempt to clean tubes by blowing steam through individual tubes. This overheats the individual tube and results in severe expansion strains and leaking tube to tubesheet joints.

CAUTION: Do not blow out heat exchangers with air when the normal process fluids or the cleaning fluids being handled are inflammable.

13. To locate ruptured or corroded tubes or leaking joints between tubes and tube sheets, the following procedure is recommended;

...Remove tube side channel covers or bonnets.

...Pressurize the shell side of the exchanger with a cold liquid, preferably water.

...Observe tube joints and tube ends for indication of test fluid leakage.

14. With certain styles of exchangers, it will be necessary to buy or make a test ring to seal off the space between the floating tubesheet and shell inside diameter to apply the test in paragraph 13. Consult your nearest sales representative for reference drawings showing installation of a test ring in your heat exchanger.

15. To tighten a leaking tube joint, use a suitable parallel roller tube expander.

...Do not roll tube beyond the back face of the tubesheet. Maximum rolling depth should be tubesheet thickness minus 1/8".

...Do not re-roll tubes which are not leaking since this needlessly thins the tube wall.

16. It is recommended that when a heat exchanger is dismantled, new gaskets be used in reassembly.

...Composition gaskets become brittle and dried out in service and do not provide an effective seal when reused.

...Metal or metal jacketed gaskets in initial compression match the contact surfaces and tend to work harden and cannot be recompressed on reuse.

17. Use of new bolting in conformance with dimensions and ASTM specifications of the original design is recommended where frequent dismantling is encountered.

GENERAL INFORMATION OPERATING AND MAINTENANCE OF HEAT EXCHANGERS

TABLE 1
RECOMMENDED START-UP AND SHUT-DOWN PROCEDURES

Caution: Every effort should be made to avoid subjecting the unit to thermal shock, overpressure and/or hydraulic hammer, since these conditions may impose stresses that exceed the mechanical strength of the unit or the system in which it is installed which may result in leaks and/or other damage to the unit and/or system.

Heat Exchanger Type of Construction	Fluid Location & relative Temp.				Start-Up Procedure	Shut-Down Procedure
	Shell side		Tube side			
	Type of Fluid	Rel. Temp.	Type of Fluid	Rel. Temp.		
Fixed Tubesheet (Non removable) Bundle	Liquid	Hot	Liquid	Cold	Start both fluids gradually at the same time	Shut down both fluids gradually at the same time
	Condensing Gas (i.e. Steam)		Liquid or Gas			
	Gas		Liquid		Start cold fluid first, then hot fluid	Shut down cold fluid gradually then hot fluid
	Liquid	Cold	Gas	Hot	Start both flows gradually at the same time	Shut down both fluids gradually at the same time
			Start cold fluid first, then hot fluid		Shut down hot fluid first, then cold fluid	
U-Tube Packed Floating Head Packed Floating Tubesheet Internal Floating Heat (All these types have Removable Bundles)	Liquid	Hot	Liquid	Cold	Start cold fluid first, then start hot fluid gradually	Shut down hot fluid first, then cold fluid
	Condensing Gas (i.e. Steam)		Liquid or Gas			Shut down cold fluid first, then shut down hot fluid gradually
	Gas		Liquid			Hot
	Liquid	Gas				

General Comments:

- 1) In all start-up and shut-down operations, fluid flows should be regulated so as to avoid thermal shocking the unit regardless of whether the unit is of either a removable or non-removable type construction.
- 2) For fixed tubesheet (non-removable bundle) type units where the tube side fluid cannot be shut down, it is recommended that (1) A bypass arrangement be incorporated in the system, and (2) The tube side fluid be bypassed before the shell side fluid is shut down.

E-mail: flo@flovex.it - www.flovex.it

**AZIENDA CON SISTEMA QUALITÀ
CERTIFICATO DA DNV
= UNI EN ISO 9001 =**

Fin dalla sua fondazione, 1977, la Flovex ha operato con professionalità nel campo degli scambiatori di calore per oleodinamica e lubrificazione.

Nel mondo stanno funzionando più di 100.000 impianti con scambiatori Flovex.

Una forte tendenza a seguire le richieste del mercato e dei clienti ha permesso a Flovex di espandersi durante gli anni sia in Italia che in numerosi Paesi europei distinguendosi per la sua alta qualità (ISO 9001) e la certificazione ASME (U-STAMP).

La medesima qualità è stata posta nella progettazione e costruzione della nuova linea FILTRI per olio DUPLEX e singoli.

Il nostro standard di costruzione è in accordo ad ASME VIII DIV. 1 ed API 614.

Vengono normalmente impiegati acciaio al carbonio ed acciaio inossidabile nei vari gradi richiesti.

Tutti gli apparecchi vengono collaudati secondo il nostro sistema di qualità ISO 9001. Secondo le normative e le esigenze necessarie si eseguono anche collaudi con Enti riconosciuti come LL.RR., B.V., DNV,... e la stampigliatura U-STAMP.

La Flovex utilizza cartucce filtro dei più qualificati costruttori per rispettare i valori di filtrazione richiesti.

Since its foundation, 1977, Flovex has been operating with authority in the field of heat exchangers lubrication systems.

More than 100.000 implants are working in the world with our heat exchangers.

A strong orientation of the market and of the customer requirements has allowed Flovex to expand over the years both on the national territory and in many European countries with a continuous track record of high quality (ISO 9001) and certification ASME (U-STAMP).

The same quality was used in projecting and constructing the new family of DUPLEX or single FILTERS for oil.

Our standard of construction is according to ASME VIII Div. 1 and API 614 codes.

Carbon steel and stainless steel are the materials usually used.

All the manufactures are tested according to our quality system ISO 9001.

According to the codes and necessities even tests by LL.RR., B.V., DNV,... and U-STAMP are done.

Flovex uses cartridges of the most qualified factories to respect the values of filtration requested.

- Portata max di olio tipo ISO VG32
- Codice di costruzione: ASME VIII Div. 1 - API 614
- Esecuzione flangiata a 3 vie con sfera in acciaio inox
- Sfiati e drenaggio: Ø 1/2" NPT-F
- Tubazione di by-pass Ø 1/2" con valvola
- Sistema DAVIT secondo codice

- Max flowrate of oil ISO VG32 type
- Construction code: ASME VIII Div. 1 - API 614
- 3 way flanged execution with int. boll 316 in stainl. steel
- Vent & drain: Ø 1/2" NPT-F
- By-pass tubing Ø 1/2" with bool valve
- DAVIT system according code
